

CROWDBEATS V2 — LOCATION-FIRST PUBLIC DISCOVERY REDESIGN

Google Stitch + Stitch Loop + Gemini + Banana Pro

You are modifying the CURRENT Crowdbeats V2 cross-platform mobile and web application.

This prompt OVERRIDES the previous public discovery first-screen design that used three large primary options:

- Nearby
- Popular
- Live Now

That previous design direction is rejected.

DO NOT continue using that first-screen layout.

The new Crowdbeats public discovery screen must instead use this strict hierarchy:

1. LOCATION SEARCH
2. COMPACT GOOGLE MAP
3. TOP 5 NEARBY MUSICIANS / BANDS
4. TOP 3 POPULAR MUSICIANS / BANDS

"Live Now" must NOT be a separate primary category.

Live status must instead appear contextually inside Nearby musician/band cards and map markers.

PRIMARY PRODUCT GOAL

When someone opens Crowdbeats, they should immediately understand:

"What musicians and bands are around me?"

The experience should feel:

premium

fast

location-aware

music-first

simple

personal

visual

effortless

modern

high-end

Do not overwhelm the first screen with controls.

Do not make the first screen feel like a dashboard.

Do not require authentication for discovery.

STRICT FIRST-SCREEN HIERARCHY

The mobile first-screen layout must follow this order:

CROWDBEATS HEADER

LOCATION SEARCH

COMPACT GOOGLE MAP

NEARBY

Top 5 nearby solo musicians and/or bands

POPULAR

Top 3 popular solo musicians and/or bands

BOTTOM NAVIGATION

This visual order is mandatory.

1 — HEADER

Keep the header minimal.

Recommended:

Crowdbeats wordmark/logo

Optional short line:

"Discover music around you"

Do not use oversized greetings.

Do not say:

"Seize the day"

Do not mimic Uber/Lyft wording.

Crowdbeats must have its own identity.

2 — LOCATION SEARCH

Place a large search field near the top.

Placeholder:

Search city, town, state or country

Correct spelling is required.

Example searches:

Torrance, California

Palm Springs, California

Los Angeles, California

San Diego, California

Austin, Texas

Nashville, Tennessee

London, United Kingdom

Auckland, New Zealand

The search bar must support Google Places-compatible location autocomplete.

LOCATION AUTOCOMPLETE

As the visitor types:

"Tor"

show geographic results such as:

Torrance, CA, USA

Toronto, ON, Canada

Torquay, England, UK

Search should prioritize:

locality

city

town

municipality

administrative area

state/province

country

Do not mix musician names into this specific location-search field.

Artist search may exist elsewhere.

LOCATION SELECTION

When user selects:

Torrance, CA, USA

Crowdbeats must:

update discovery location

move compact map to Torrance

refresh nearby artist query

refresh nearby band query

refresh live performers

refresh popular-in-area results where appropriate

update displayed location context

Do not pretend the user's physical GPS location changed.

Maintain separately:

deviceLocation

discoveryLocation

3 — COMPACT GOOGLE MAP

Immediately underneath the search field place a compact interactive Google Map.

THIS IS IMPORTANT.

The map must come BEFORE any musician cards.

Do not place categories above it.

Do not make the map full screen.

Do not make it as tall as the previous Crowdbeats Nearby design.

Recommended mobile height:

approximately 200–280 logical pixels depending on device.

The map must feel like a visual preview.

COMPACT MAP CONTENT

Display:

current device position when authorized

OR

selected discovery area's center

Nearby musician/band markers

Live Now markers

Optional venue markers only when useful

Keep the first-screen map visually calm.

Prefer approximately:

3–8 visible relevant markers

depending on map zoom and density.

Use marker clustering when necessary.

CREATOR MAP MARKERS

Artist/band marker may display:

profile image

small ring/status treatment

live indicator

selected state

Do not overload the marker with text.

When selected, show a small preview.

Example:

Jake Rios 0.3 mi LIVE

[View Profile]

[Tip]

If unauthenticated:

Tip invokes authentication gate.

MAP PRIVACY

Never publicly display:

home address

residential coordinates

private GPS history

Stripe address

billing location

private registration address

IP-derived address

A musician/band may appear based only on:

public performance venue

approved public live location

creator-selected public location

public city/general area

verified event location

Never expose someone's home through discovery.

MAP INTERACTION

Provide subtle controls:

recenter

use current location

expand map

Tap map or expand control:

open full Nearby map experience.

The first-screen map is only the compact discovery preview.

4 — NEARBY SECTION

Immediately below the compact map create:

Nearby

Optional subtitle:

Music around [location]

Example:

Nearby Music around Torrance

Display exactly:

TOP 5 RELEVANT NEARBY PROFILES

unless fewer than five valid profiles exist.

Never create fake filler profiles.

Results may contain:

solo musician

band

or a combination of both.

Ranking should prioritize legitimate geographic proximity and current relevance.

NEARBY CARD DESIGN

Each Nearby profile should use a premium compact card.

Each card should include:

large profile image or band image

artist/band name

verified badge when genuinely verified

distance

genre(s)

live status when applicable

venue when applicable

short AI-generated profile summary

Tip CTA

View Profile affordance

Favorite/Follow icon where appropriate

Do not make cards overly tall.

LIVE NOW INTEGRATION

Live Now must be integrated into Nearby.

Examples:

green LIVE badge

subtle live border

"Live now at The Holding Company"

"Performing now"

"On stage"

Do NOT create a separate Live Now section on the first page.

A live musician should naturally rank highly in Nearby when geographically relevant.

NEARBY RANKING

Create a server-authoritative ranking model.

Possible signals:

geographic distance

currently live

scheduled performance soon

profile quality

verified status

relevance to location

recent activity

engagement

Do not rank solely by tip amount.

Do not expose financial information as a popularity ranking mechanism.

Suggested conceptual scoring:

nearbyScore = distance relevance

- live relevance
- active performance relevance
- profile quality
- bounded engagement signal

Do not let clients directly write nearbyScore.

Calculate through trusted backend logic.

AI-GENERATED PROFILE SUMMARIES

This is a major product requirement.

Every Nearby and Popular profile card should be capable of showing a short memorable AI-generated summary based ONLY on approved public profile data.

The summaries should feel:

human

distinctive

musical

concise

premium

memorable

informative

Do not generate generic filler.

Example:

Jake Rios

"Indie-folk storyteller blending warm acoustic guitar with late-night California energy."

Example:

Midnight Riders

"Four-piece rock band mixing country grit, blues swagger and crowd-driven live sets."

Example:

Luna Causey

"Soulful R&B vocals, stripped-back acoustics and a stage presence built for intimate rooms."

AI SUMMARY LENGTH

Target:

approximately 8–18 words.

Do not write paragraphs.

The summary should fit neatly inside a profile card.

AI SUMMARY DATA SOURCES

The AI may use only approved public profile fields such as:

public artist name

band name

public bio

genre

subgenres

instruments

musical influences

performance description

public city

public venue context

public campaign description where relevant

publicly selected profile keywords

Never use:

private messages

payment history

Stripe data

bank information

email

phone number

private location

identity documents

moderation notes

internal risk scores

private analytics

AI HALLUCINATION PROTECTION

The AI MUST NOT invent:

awards

stream counts

record deals

celebrity endorsements

festival appearances

venue appearances

years of experience

band members

touring history

albums

songs

genres

locations

unless the information exists in approved profile data.

If there is not enough profile data:

use a safe deterministic fallback.

Example:

"Independent musician bringing original live music to the Crowdbeats community."

For band:

"Independent band performing original music and connecting with fans through Crowdbeats."

AI SUMMARY GENERATION ARCHITECTURE

Do NOT run generative AI every time a user opens the discovery screen.

Generate summaries:

when profile is created

when significant public profile information changes

when creator explicitly refreshes summary where allowed

or through controlled backend jobs

Store:

aiCardSummary

aiSummaryVersion

aiSummaryGeneratedAt

aiSummarySourceHash

aiSummaryStatus

Possible status:

PENDING

APPROVED

ACTIVE

REVIEW_REQUIRED

REJECTED

FALLBACK

AI MODERATION

AI-generated summaries must also pass content moderation.

The AI must never introduce:

sexual language

hate

harassment

defamation

unsupported claims

illegal content

copyrighted lyric excerpts

personal information

If moderation fails:

use deterministic fallback summary.

CREATOR CONTROL

Creators may optionally review their generated short profile summary.

Recommended behavior:

AI suggests summary

creator may:

Accept

Request Regenerate

Edit within policy constraints

Admin/moderation rules still apply.

Do not let creators inject unsafe HTML or scripts.

NEARBY CARD EXAMPLE

Conceptually:

[PROFILE IMAGE]

LIVE

Jake Rios ✓

0.3 mi Indie • Folk • Acoustic

"Indie-folk storyteller blending warm acoustic guitar with late-night California energy."

The Holding Company

[View Profile] [Tip]

The actual layout should be refined through Google Stitch.

PROFILE CARD TAP

Tap the card:

open:

/artist/{creatorSlug}

or

/band/{bandSlug}

No login required.

TIP BUTTON

A visible Tip button may appear on public cards.

Unauthenticated user:

Tap Tip

authentication gate

Sign In / Create Account

return to exact profile/card

preserve selected creator

allow amount selection or preserve previously selected amount

explicit confirmation

Stripe payment

Do not automatically charge after authentication.

5 — POPULAR SECTION

After the five Nearby profiles create:

Popular

Optional subtitle:

Popular around [location]

or:

Trending on Crowdbeats

Display:

TOP 3 POPULAR PROFILES

These may be:

solo musicians

bands

or both.

POPULAR CARD DESIGN

Popular cards should visually relate to Nearby cards but may emphasize discovery.

Show:

profile image

artist/band name

verified badge

genre

short AI-generated unforgettable summary

popular/trending indicator

optional public performance location

View Profile

Tip

Do not display raw payment totals.

POPULARITY MODEL

Popularity must be calculated through backend-controlled signals.

Possible privacy-safe signals:

unique profile views

favorites/follows

public engagement

recent live performance activity

campaign engagement

repeat discovery activity

bounded aggregate tipping activity if legally/privacy appropriate

Do NOT expose:

individual tip amounts

fan payment histories

specific fan identities

financial rankings

raw revenue

Do not allow creators to write popularityScore.

POPULAR LOCATION LOGIC

When browsing user's current location:

show popularity relevant to area.

When searching:

Torrance, CA

show popular artists related to the Torrance discovery area where enough data exists.

If insufficient local data:

gracefully widen scope.

Example:

Popular near Torrance

↓

South Bay

↓

Los Angeles region

↓

Popular on Crowdbeats

Communicate scope honestly.

FIRST-SCREEN CONTENT LIMITS

First discovery page should generally contain:

1 location search

1 compact map

5 nearby creator cards

3 popular creator cards

Do NOT add:

20 additional categories

large filter panels

campaign carousels

venue grids

full analytics

dense genre chips

full Map/List/Venues selector

to the first page.

Keep deeper functionality available through:

See All

View Map

Profile

Nearby tab

search

SECTION ACTIONS

Nearby header:

Nearby See All

Popular:

Popular See All

"See All Nearby" opens full Nearby discovery.

"See All Popular" opens full Popular discovery.

SCROLL EXPERIENCE

The page should naturally scroll:

Search

Map

Nearby 1

Nearby 2

Nearby 3

Nearby 4

Nearby 5

Popular 1

Popular 2

Popular 3

Bottom spacing/nav

Do not create awkward horizontal-scroll dependency for all content.

Stitch may explore:

vertical cards

compact horizontal cards

or hybrid

but mobile readability is priority.

GOOGLE STITCH INSTRUCTION

Use Google Stitch to redesign this screen.

Generate multiple variants specifically around:

SEARCH → MAP → NEARBY → POPULAR

Do not return to the rejected:

SEARCH → THREE CATEGORY BUTTONS

layout.

That direction is no longer approved.

STITCH LOOP REQUIREMENT

Use Stitch Loop iteratively.

Iteration objective:

reduce visual noise while preserving rich musician discovery.

Evaluate:

map size

card density

profile image size

summary readability

Tip CTA prominence

section spacing

location context

thumb usability

bottom navigation visibility

Run at least several iterations until the design achieves a clear hierarchy.

GEMINI UX REVIEW

Use Gemini to critique every major Stitch candidate.

Ask:

1. Does the user's eye go to location search first?
2. Does the map clearly establish place?
3. Are nearby musicians the next obvious content?
4. Is Live Now understandable without becoming a separate section?
5. Are AI summaries useful or visually noisy?
6. Are five Nearby profiles appropriate?
7. Are three Popular profiles clearly differentiated?
8. Can the user understand Crowdbeats without authentication?
9. Is tipping obvious but not intrusive?
10. Does this feel like a premium music platform rather than a rideshare clone?

Reject any design that fails these questions.

BANANA PRO / NANO BANANA PRO

Use Banana Pro where helpful for:

artist profile-card visual exploration

map marker treatments

premium music imagery

subtle card backgrounds

empty-state imagery

Do not use it to generate fake profile identities for production.

Generated visual placeholders are allowed only in design/mock mode.

Production must use actual creator-uploaded approved profile media.

MOBILE VISUAL DIRECTION

Use:

deep black background

near-black cards

Crowdbeats purple

white primary typography

muted gray secondary typography

green only where clearly indicating Live

large rounded profile images

soft card corners

minimal shadows

subtle gradients

premium spacing

Avoid rainbow color overload.

MAP TO CARD VISUAL RELATIONSHIP

Map markers and Nearby cards should feel connected.

Example:

selected Jake Rios marker

↓

Jake Rios card becomes visually selected

or map preview panel opens.

If user taps Nearby card location:

optionally highlight map marker.

FULL NEARBY EXPERIENCE

The existing richer Nearby interface must remain available.

The detailed screen may still include:

Map

List

Venues

filters

genre

distance

full map

larger result set

The first discovery screen is simply a premium preview.

Do not delete existing functionality.

PUBLIC AUTHENTICATION MODEL

No login required for:

launch app

search locations

view compact map

view Nearby cards

view Popular cards

view profiles

view public venue information

view public campaigns where permitted

Login required for:

Tip

Follow

Favorite if account persistence required

Message

Activity

creator dashboard

band management

campaign creation

Stripe Connect

payouts

account settings

FIREBASE PUBLIC QUERY SECURITY

Do not make private user records public.

Public discovery should query safe public projections only.

Recommended conceptual separation:

creatorPublic

creatorPrivate

or equivalent architecture.

Public result may contain:

creatorId

creatorSlug

displayName

profileImage

publicBio

aiCardSummary

genres

publicLocation

liveStatus

distance/query location metadata

verified status

public performance

discovery ranking metadata

Do NOT expose:

email

phone

home address

bank information

Stripe IDs unless server-only

legal identity data

moderation notes

private GPS

private profile fields

GEO QUERY ARCHITECTURE

Use scalable Firestore geographic queries.

Do not download all musicians and calculate distances client-side.

Use appropriate:

geohash indexing

geo bounds

pagination

query limits

backend ranking

Cache responsibly.

TOP FIVE NEARBY LOGIC

Retrieve enough eligible candidates to rank safely.

Example conceptual pipeline:

geo candidate query

↓

public eligibility filter

↓

moderation filter

↓

live/performance relevance

↓

distance

↓

ranking

↓

top five

Never trust client-side eligibility.

LIVE STATUS

Live Now should be represented as metadata.

Possible fields:

isLive

liveStartedAt

liveEndsAt

performanceId

venueId

publicLiveLocationApproved

liveVerificationStatus

A creator cannot arbitrarily manipulate Live status to boost discovery.

Use server-controlled verification where appropriate.

PROFILE IMAGE REQUIREMENTS

Use:

creator-approved public profile photo

band-approved image

or safe placeholder.

Do not crop faces badly.

Use consistent aspect ratio.

Google Stitch should determine the best production card ratio.

AI SUMMARY UX

Summary should feel integrated.

Do not label every card:

"AI-generated summary"

That creates visual noise.

Provide transparency elsewhere, such as profile/edit/settings information if needed.

The card simply displays the concise public description.

LOADING STATES

Map:

skeleton / map loading state

Nearby:

five appropriate skeleton cards

Popular:

three appropriate skeleton cards

Do not flash empty screens during query.

EMPTY NEARBY STATE

If no artists exist nearby:

"No musicians found nearby yet."

Actions:

Expand search area

Search another city

Explore popular musicians

Do not invent results.

ERROR STATE

If location provider fails:

"We couldn't load this area."

Offer:

Retry

Search location

Use current location

The entire Crowdbeats app must not fail because Maps fails.

OFFLINE / LIMITED CONNECTION

If previously cached safe discovery data exists:

show appropriately stale/cached results where architecture permits.

Indicate when location data cannot refresh.

Do not cache sensitive private coordinates.

RESPONSIVE WEB VERSION

Apply the same hierarchy to Crowdbeats web:

Search

Compact Map

Top 5 Nearby

Top 3 Popular

Desktop may use:

larger map

2-column card layouts

balanced spacing

but must retain identical product hierarchy.

Do not make desktop a completely separate experience.

BOTTOM NAVIGATION

Preserve current primary mobile navigation unless architecture already changed it.

Recommended:

Home

Nearby

Tip

Activity

Profile

Public visitor:

Home works

Nearby works

Tip triggers auth when payment action begins

Activity triggers auth

Profile presents sign-in/account state

ACCESSIBILITY

Ensure:

screen reader labels

keyboard web navigation

large touch targets

map alternative via Nearby list

adequate contrast

dynamic text support

semantic headings

AI summaries must not be the only source of important artist information.

ANALYTICS

Track privacy-safe events:

discovery_home_opened

location_search_started

location_selected

compact_map_opened

nearby_profile_impression

nearby_profile_opened

popular_profile_impression

popular_profile_opened

tip_clicked

tip_auth_gate_triggered

Do not include private location precision unless privacy-reviewed.

Use coarse location identifiers where sufficient.

TEST REQUIREMENTS

Create tests verifying:

1. application opens without authentication
2. search appears above map
3. compact map appears immediately below search
4. exactly up to five Nearby profiles appear
5. up to three Popular profiles appear

6. Live Now appears inside applicable Nearby cards
7. no separate first-screen Live Now category exists
8. city search updates map
9. city search updates Nearby profiles
10. city search updates Popular profiles
11. Torrance, California autocomplete works using provider mock/test
12. artist profile opens without authentication
13. band profile opens without authentication
14. public visitor tapping Tip receives auth gate
15. creator context survives authentication
16. private home location is never returned
17. client cannot alter ranking score
18. client cannot manipulate Live status
19. AI summaries use approved public profile data only
20. AI summary fallback works
21. AI summary moderation works
22. Nearby result eligibility is backend enforced
23. suspended creator excluded where policy requires
24. terminated creator excluded
25. demonetized creator visibility follows policy independently of payment eligibility
26. demonetized creator cannot receive a tip
27. responsive web layout works
28. mobile layout works

E2E SCENARIO — TORRANCE

Launch Crowdbeats logged out.

Expected:

Search field

Compact map

Nearby

Popular

No authentication wall.

Search:

Torrance

Select:

Torrance, CA, USA

Expected:

map centers on Torrance

Nearby updates

five or fewer legitimate nearby creators appear

Popular updates

three or fewer legitimate popular creators appear

one live creator displays:

LIVE

inside Nearby card if valid test fixture exists

Open creator.

No login required.

Tap Tip.

Authentication required.

Authenticate.

Return to same creator.

Require explicit payment confirmation.

FINAL STITCH ACCEPTANCE

The finished screen must visually communicate:

SEARCH

PLACE

PEOPLE NEARBY

PEOPLE WORTH DISCOVERING

The screen must NOT communicate:

MENU OF CATEGORIES

This distinction is critical.

REQUIRED DESIGN REPORT

Create:

docs/design/LOCATION_FIRST_DISCOVERY_REDESIGN.md

docs/design/STITCH_LOOP_LOCATION_DISCOVERY.md

docs/design/AI_PROFILE_CARD_SUMMARY_SPEC.md

docs/design/DISCOVERY_CARD_COMPONENTS.md
